A denial of service vulnerability exists when the ASP.NET Core fails to properly validate web requests. NOTE: Microsoft has not commented on third-party claims that the issue is that the `TextEncoder.EncodeCore` function in the `System.Text.Encodings.Web` package in ASP.NET Core Mvc before 1.0.4 and 1.1.x before 1.1.3 allows remote attackers to cause a denial of service by leveraging failure to properly calculate the length of 4-byte characters in the Unicode Non-Character range.

<p>Medium 6.1</p> <p> CVE-2012-6708</p> <p> 2018-01-18</p>	<p> jquery-1.8.3.min.js</p> <p>Latest Stable Version: 3.6.0</p> <p>Projects: IR35</p>	<p>jQuery before 1.9.0 is vulnerable to Cross-site Scripting (XSS) attacks. The jQuery(strInput) function does not differentiate selectors from HTML in a reliable fashion. In vulnerable versions, jQuery determined whether the input was HTML by looking for the '<' character anywhere in the string, giving attackers more flexibility when attempting to construct a malicious payload. In fixed versions, jQuery only deems the input to be HTML if it explicitly starts with the '<' character, limiting exploitability only to attackers who can control the beginning of a string, which is far less common.</p>	<p>Upgrade to version jQuery - v1.9.0</p> <p>Details: https://nvd.nist.gov/vuln/detail/CVE-2012-6708</p>
